Operating Systems and Networks

Networks Part 2: Physical Layer

Adrian Perrig Network Security Group ETH Zürich

Overview

- Important concepts from last lecture
 - Statistical multiplexing, statistical multiplexing gain
 - OSI 7 layer model, interfaces, protocols
 - Encapsulation
- This lecture
 - Socket programming overview
 - Physical layer
- Online lecture videos: http://computernetworks5e.org

Network-Application Interface

- Defines how apps use the network
 - Lets apps talk to each other via hosts; hides the details of the network

Computer Networks

3

Motivating Application

Simple client-server connection setup

Computer Networks

Motivating Application (2)

- Simple client-server connection setup
 - Client app sends a request to server app
 - Server app returns a (longer) reply
- This is the basis for many apps!
 - File transfer: send name, get file (§6.1.4)
 - Web browsing: send URL, get page
 - Echo: send message, get it back
- Let's see how to write this app ...

Computer Networks

5

Socket API

- Simple abstraction to use the network
 - The network service API used to write all Internet applications
 - Part of all major OSes and languages; originally Berkeley (Unix)
 ~1983
- Supports two kinds of network services
 - Streams: reliably send a stream of bytes
 - Datagrams: unreliably send separate messages. (Ignore for now.)

Computer Networks

Socket API (2)

 Sockets let apps attach to the local network at different ports

Computer Networks

7

Socket API (3)

Primitive	Meaning
SOCKET	Create a new communication endpoint
BIND	Associate a local address with a socket
LISTEN	Announce willingness to accept connections; give queue size
ACCEPT	Passively establish an incoming connection
CONNECT	Actively attempt to establish a connection
SEND	Send some data over the connection
RECEIVE	Receive some data from the connection
CLOSE	Release the connection

Computer Networks

Client Program (outline) // make socket socket() getaddrinfo() // server and port name // www.example.com:80 // connect to server [block] connect() // send request send() // await reply [block] recv() // do something with data! // done, disconnect close() 12 **Computer Networks**

Server Program (outline)

```
// make socket
socket()
getaddrinfo()
                 // for port on this host
                 // associate port with socket
bind()
                 // prepare to accept connections
listen()
                  // wait for a connection [block]
accept()
                  // wait for request
recv()
                 // send the reply
send()
                 // eventually disconnect
close()
```

Computer Networks

13

Where we are in the Course

 Beginning to work our way up starting with the Physical layer

Application
Transport
Network
Link
Physical

Computer Networks

Scope of the Physical Layer

- Concerns how signals are used to transfer message bits over a link
 - Wires etc. carry analog signals
 - We want to send digital bits

Computer Networks

15

Topics

- 1. Properties of media
 - Wires, fiber optics, wireless
- 2. Simple signal propagation
 - Bandwidth, attenuation, noise
- 3. Modulation schemes
 - Representing bits, noise
- 4. Fundamental limits
 - Nyquist, Shannon

Computer Networks

Simple Link Model

- We'll end with an abstraction of a physical channel
 - Rate (or bandwidth, capacity, speed) in bits/second
 - Delay or <u>Latency</u> in seconds, related to length

- Other important properties:
 - Whether the channel is broadcast, and its error rate

Computer Networks

17

Message Latency

- Latency L: delay to send a message over a link
 - Transmission delay: time to put M-bit message "on the wire"

```
T-delay = M (bits) / Rate (bits/sec) = M/R seconds
```

- Propagation delay: time for bits to propagate across the wire

```
P-delay = Length / speed of signals = Length / ¾c = D seconds
```

- Combining the two terms we have: L = M/R + D

Computer Networks

Metric Units

The main prefixes we use:

Prefix	Exp.	prefix	exp.
K(ilo)	10 ³	m(illi)	10 ⁻³
M(ega)	10 ⁶	μ(micro)	10 ⁻⁶
G(iga)	10 ⁹	n(ano)	10 ⁻⁹

- Use powers of 10 for rates, 2 for storage or data size
 - -1 Mbps = 1,000,000 bps, 1 KB = 2^{10} bytes
- "B" is for bytes, "b" is for bits

Computer Networks

19

Latency Examples

- "Dialup" with a telephone modem:
 - D = 5 ms, R = 56 kbps, M = 1250 bytes
- Broadband cross-country link:
 - D = 50 ms, R = 10 Mbps, M = 1250 bytes

Computer Networks

Latency Examples (2)

• "Dialup" with a telephone modem:

D = 5 ms, R = 56 kbps, M = 1250 bytes
L = 5 ms +
$$(1250x8)/(56 \times 10^3)$$
 sec = 184 ms!

Broadband cross-country link:

D = 50 ms, R = 10 Mbps, M = 1250 bytes
L = 50 ms +
$$(1250x8) / (10 x 10^6)$$
 sec = 51 ms

- A long link or a slow rate means high latency
 - Often, one delay component dominates

Computer Networks

21

Bandwidth-Delay Product

Messages take space on the wire!

 The amount of data in flight is the <u>bandwidth-delay (BD)</u> <u>product</u>

$$BD = R \times D$$

- Measure in bits, or in messages
- Small for LANs, big for "long fat" pipes

Computer Networks

Bandwidth-Delay Example

Fiber at home, cross-country
 R=40 Mbps, D=50 ms

BD = $40 \times 10^6 \times 50 \times 10^{-3}$ bits

= 2000 Kbit

= 250 KB

That's quite a lot of data "in the network"!

Computer Networks

2

How "Long" is a Bit?

- Interesting trivia: how "long" is the representation of a bit on a wire?
- Considering a fiber optic cable
 - Signal propagation speed: 200'000'000 m/s
 - Sending rate: 1Gbps → duration of sending one bit: 1ns
 - Bit "length": 1ns * 200'000'000 m/s = 0.2 m
 - "Length" of a 1Kb packet: 0.2m * 8 * 2^{10} = 1.6km

Types of Media (§2.2, 2.3)

- Media propagate <u>signals</u> that carry <u>bits</u> of information
- We'll look at some common types:
 - Wires
 - Fiber (fiber optic cables)
 - Wireless

Computer Networks

2.

Wires - Twisted Pair

- Very common; used in LANs and telephone lines
 - Twists reduce radiated signal

Computer Networks

Wires - Coaxial Cable

Also common. Better shielding for better performance

• Other kinds of wires too: e.g., electrical power (§2.2.4)

Computer Networks

27

Fiber

- · Long, thin, pure strands of glass
 - Enormous bandwidth (high speed) over long distances

Fiber (2)

 Two varieties: multi-mode (shorter links, cheaper) and single-mode (up to ~100 km)

Fiber bundle in a cable

Computer Networks

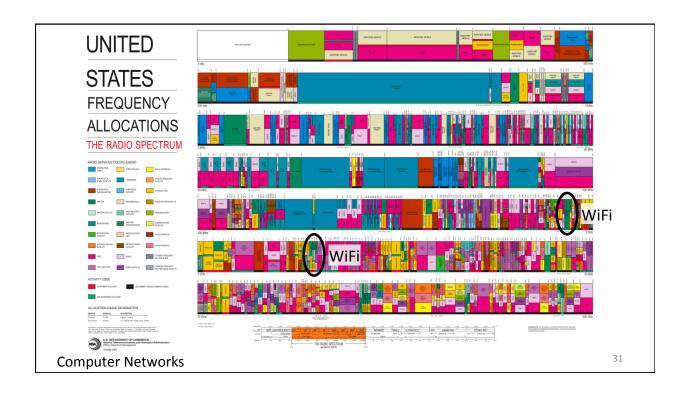

29

Wireless

- Sender radiates signal over a region
 - In many directions, unlike a wire, to potentially many receivers
 - Nearby signals (same freq.) <u>interfere</u> at a receiver; need to coordinate use

Computer Networks

Wireless (2)

 Microwave, e.g., 3G, and unlicensed (ISM (Industry Science Medicine) frequencies, e.g., WiFi, are widely used for computer networking

Signals (§2.2, 2.3)

 Analog signals encode digital bits. We want to know what happens as signals <u>propagate</u> over media

Computer Networks

Frequency Representation

 A signal over time can be represented by its frequency components (called Fourier analysis)

$$g(t) = \frac{1}{2}c + \sum_{n=1}^{\infty} a_n \sin(2\pi n f t) + \sum_{n=1}^{\infty} b_n \cos(2\pi n f t)$$

$$1 = \frac{1}{2} \sum_{n=1}^{\infty} a_n \sin(2\pi n f t) + \sum_{n=1}^{\infty} b_n \cos(2\pi n f t)$$
Signal over time \rightarrow

$$1 = \frac{1}{2} \sum_{n=1}^{\infty} a_n \sin(2\pi n f t) + \sum_{n=1}^{\infty} b_n \cos(2\pi n f t)$$
weights of harmonic frequencies

Computer Networks

Effect of Less Bandwidth

Fewer frequencies (=less bandwidth) degrades signal

Signals over a Wire

- What happens to a signal as it passes over a wire?
 - 1. The signal is delayed (propagates at ⅔c)
 - 2. The signal is attenuated (goes for m to km)
 - 3. Frequencies above a cutoff are highly attenuated
 - 4. Noise is added to the signal (later, causes errors)

EE: Bandwidth = width of frequency band, measured in Hz CS: Bandwidth = information carrying capacity, in bits/sec

Computer Networks

3

Signals over a Wire (2)

Example:

2: Attenuation:

Sent signal ____

3: Bandwidth:

4: Noise:

Computer Networks

Signals over Fiber

- Light propagates with very low loss in three very wide frequency bands
 - Use a carrier to send information

Computer Networks

39

Signals over Wireless

 Signals transmitted on a carrier frequency, like fiber (more later)

Computer Networks

Signals over Wireless (2)

 Travel at speed of light, spread out and attenuate faster than 1/dist²

Computer Networks

41

Signals over Wireless (3)

Multiple signals on the same frequency interfere at a receiver

Computer Networks

Signals over Wireless (4)

Interference leads to notion of <u>spatial reuse</u> (of same freq.)

Computer Networks

43

Signals over Wireless (5)

- Various other effects too!
 - Wireless propagation is complex, depends on environment
- Some key effects are highly frequency dependent
 - E.g., <u>multipath</u> at microwave frequencies

Computer Networks

Wireless Multipath

- Signals bounce off objects and take multiple paths
 - Some frequencies attenuated at receiver, varies with location
 - Messes up signal; handled with sophisticated methods

Computer Networks

45

Modulation (§2.5)

- We've talked about signals representing bits. How, exactly?
 - This is the topic of modulation

Computer Networks

A Simple Modulation

- Let a high voltage (+V) represent a 1, and low voltage (-V) represent a 0
 - This is called NRZ (Non-Return to Zero)

Computer Networks

47

Many Other Schemes

- Can use more signal levels, e.g., 4 levels is 2 bits per symbol
- Practical schemes are driven by engineering considerations
 - E.g., clock recovery

Computer Networks

Clock Recovery

- Um, how many zeros was that?
 - Receiver needs frequent signal transitions to decode bits

```
1 0 0 0 0 0 0 0 0 0 ... 0
```

- Several possible designs
 - E.g., Manchester coding and scrambling (§2.5.1)

Computer Networks

49

Clock Recovery – 4B/5B

- Map every 4 data bits into 5 code bits without long runs of zeros
 - $-0000 \rightarrow 11110,0001 \rightarrow 01001,$ $1110 \rightarrow 11100, ... 1111 \rightarrow 11101$
 - Has at most 3 zeros in a row
 - Also invert signal level on a 1 to break up long runs of 1s (called NRZI, §2.5.1)

Computer Networks

Clock Recovery – 4B/5B (2)

- 4B/5B code for reference:
 - $-0000 \rightarrow 11110,0001 \rightarrow 01001,1110 \rightarrow 11100,...1111 \rightarrow 11101$
- Message bits: 1111 0000 0001

Computer Networks

51

Passband Modulation

- What we have seen so far is <u>baseband</u> modulation for wires
 - Signal is sent directly on a wire
- These signals do not propagate well on fiber / wireless
 - Need to send at higher frequencies
- <u>Passband</u> modulation carries a signal by modulating a carrier

Computer Networks

Passband Modulation (2)

- Carrier is simply a signal oscillating at a desired frequency:
- We can modulate it by changing:
 - Amplitude, frequency, or phase

Computer Networks

Fundamental Limits (§2.1)

- How rapidly can we send information over a link?
 - Nyquist limit (~1924)
 - Shannon capacity (1948)
- Practical systems are devised to approach these limits

Computer Networks

55

Key Channel Properties

- The bandwidth (B), signal strength (S), and noise strength (N)
 - B limits the rate of transitions
 - S and N limit how many signal levels we can distinguish

Computer Networks

Nyquist Limit

The maximum <u>symbol</u> rate is 2B

 Thus if there are V signal levels, ignoring noise, the maximum bit rate is:

 $R = 2B log_2 V bits/sec$

Computer Networks

5

Claude Shannon (1916-2001)

- Father of information theory
 - "A Mathematical Theory of Communication", 1948
- Fundamental contributions to digital computers, security, and communications

Electromechanical mouse that "solves" mazes!

Credit: Courtesy MIT Museum

Computer Networks

Shannon Capacity

- How many levels we can distinguish depends on S/N
 - Or SNR, the Signal-to-Noise Ratio
 - Note noise is random, hence some errors
- SNR given on a log-scale in deciBels:
 - $-SNR_{dB} = 10log_{10}(S/N)$

Computer Networks

50

Shannon Capacity (2)

 Shannon limit is for capacity (C), the maximum information carrying rate of the channel:

$$C = B \log_2(1 + S/N)$$
 bits/sec

Computer Networks

Wired/Wireless Perspective

- Wires, and Fiber Engineer SNR for data rate
 - Engineer link to have requisite SNR and B
 - →Can fix data rate
- Wireless

Adapt data rate to SNR

- Given B, but SNR varies greatly, e.g., up to 60 dB!
- → Can't design for worst case, must adapt data rate

Computer Networks

6

Putting it all together – DSL

- DSL (Digital Subscriber Line, see §2.6.3) is widely used for broadband; many variants offer 10s of Mbps
 - Reuses twisted pair telephone line to the home; it has up to
 2 MHz of bandwidth but uses only the lowest ~4 kHz

Computer Networks

DSL (2)

- DSL uses passband modulation (called OFDM §2.5.1)
 - Separate bands for upstream and downstream (larger)
 - Modulation varies both amplitude and phase (called QAM)
 - High SNR, up to 15 bits/symbol, low SNR only 1 bit/symbol

Computer Networks
