

Is a directory a file? • Yes... • Allocated just like a file on disk • Has entries in other directories like a file • ...and no... • Users can't be allowed to read/write to it Corrupt file system data structures Bypass security mechanisms • File system provides special interface opendir, closedir, readdir, seekdir, telldir, etc.

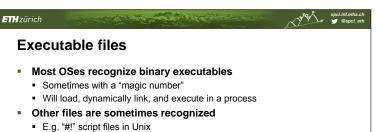

Directory implementation Linear list of (file name, block pointer) pairs Simple to program Lookup is slow for lots of files (linear scan) Hash Table – linear list with closed hashing. Fast name lookup Collisions Fixed size B-Tree – name index, leaves are block pointers Increasingly common Complex to maintain, but scales well

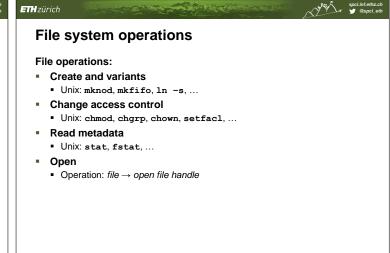

Unix also uses the file namespace for
Naming I/O devices (/dev)
Named pipes (FIFOs)
Unix domain sockets
More recently:
Process control (/proc)
OS configuration and status (/proc, /sys)
Plan 9 from Bell Labs
Evolution of Unix: almost everything is a file

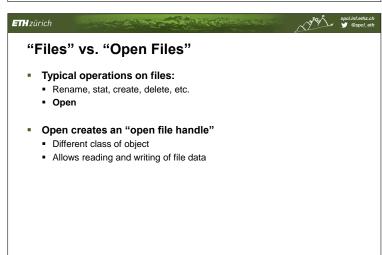

Unix devices and other file types

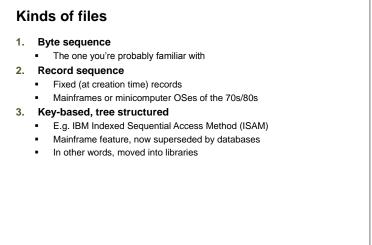

"#!/usr/bin/python"

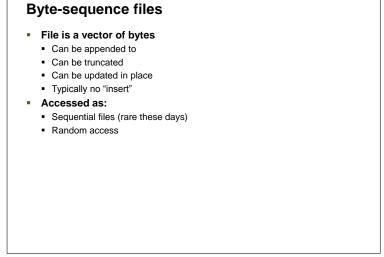

ETH zürich

- State: current position in file
- Seek absolute or relative to current position.
- Tell returns current index
- Index units:
 - For byte sequence files, offset in bytes

Record-sequence files

- File is now a vector of fixed-size records
 - Can be appended to
 - Can be truncated

ETH zürich

- Can be updated in place
- Typically no "insert"
- Record size (and perhaps format) fixed at creation time
 - Read/write/seek operations take records and record offsets instead of byte

Compare with databases!

ETH zürich **Memory-mapped files**

- Basic idea: use VM system to cache files
 - Map file content into virtual address space
 - Set the backing store of region to file
 - Can now access the file using load/store
- When memory is paged out
 - Updates go back to file instead of swap space

ETH zürich **ETH** zürich

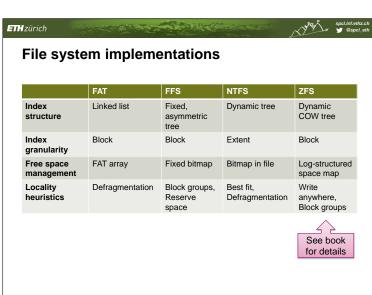

Disk addressing

- Disks have tracks, sectors, spindles, etc.
 - And bad sector maps!
- More convenient to use logical block addresses
 - Treat disk as compact linear array of usable blocks
 - Block size typically 512 bytes
 - Ignore geometry except for performance (later!)
- Also abstracts other block storage devices
 - Flash drives (load-leveling, etc.)
 - Storage-area Networks (SANs)
 - Virtual disks (RAM, RAID, etc.)

Implementation aspects

- **Directories and indexes**
 - Where on the disk is the data for each file?
- Index granularity
 - What is the unit of allocation for files?
- Free space maps
 - How to allocate more sectors on the disk?
- Locality optimizations
 - How to make it go fast in the common case

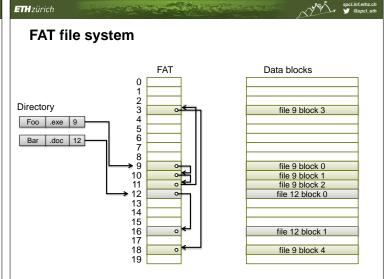

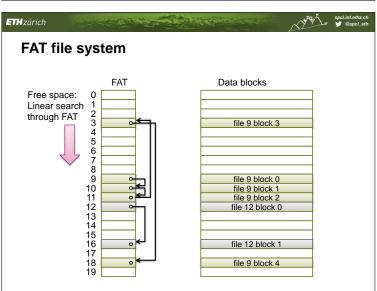

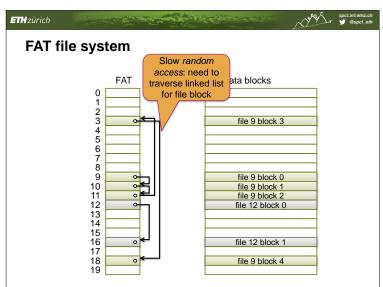

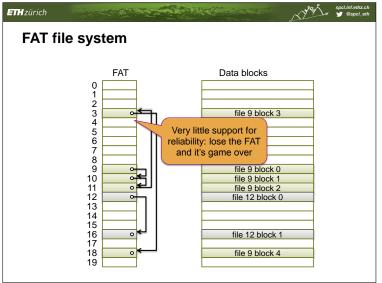

complained, "You guys are spending all this time with your segment tuning tinkering. I could teach a twelve-year-old to segment-tune. I want to see some real optimization, not this segment tuning nonsense. I wrote FAT on an airplane, for

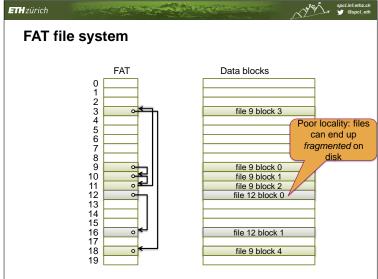

heaven's sake."

Metadata files

ETH zürich

File system metadata in NTFS is held in files!

File num.	Name	Description	
0	\$MFT	Master file table	
1	\$MFTirr	Copy of first 4 MFT entries	
2	\$Logfile	Transaction log of FS changes	
3	\$Volume	Volume information & metadata	
4	\$AttrDef	Table mapping numeric IDs to attributes	
5		Root directory	
6	\$Bitmap	Free space bitmap	
7	\$Boot	Volume boot record	
8	\$BadClus	Bad cluster map	
0	\$Secure	Access control list database	
10	\$UpCase	Filename mappings to DOS	
11	\$Extend	Extra file system attributes (e.g. quota)

In-memory Data Structures

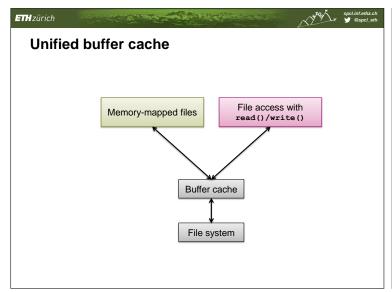

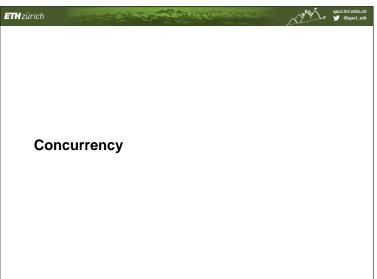

ETH zürich Spelintethzeh ■ Gspel eth

Concurrency

- Must ensure that, regardless of concurrent access, file system integrity is ensured
 - Careful design of file system structures
 - Internal locking in the file system
 - Ordering of writes to disk to provide transactions
- 2. Provide mechanisms for users to avoid conflicts themselves
 - Advisory locks
 - Mandatory locks

ETH zürich

Common locking facilities

- Type:
 - Advisory: separate locking facility
 - Mandatory: write/read operations will fail
- Granularity:
 - Whole-file
 - Byte ranges (or record ranges)
 - Write-protecting executing binaries

Compare with databases

- Databases have way better notions of:
 - Locking between concurrent users
 - Durability in the event of crashes
- Records and indexed files have largely disappeared in favor of databases
- File systems remain much easier to use
 - And much, much faster
 - As long as it doesn't matter...

Recovery

- Consistency checking compares data in directory structure with data blocks on disk, and tries to fix inconsistencies
- Use system programs to back up data from disk to another storage device (floppy disk, magnetic tape, other magnetic disk, optical)
- Recover lost file or disk by restoring data from backup
